Drug Overdose ED Visit Rate per 100k	90.60	38.24	0.00	4347.83	1828

Source: Mortality data are at the county-year and come from the Centers for Disease Control and Prevention's Multiple Cause of Death files from 1999-2014 and are adjusted as in text. ED data at the county-year level and are provided via the Healthcare Cost and Utilization Project's State Emergency Department Databases (SEDD). SEDD data come from Arizona (2005-2014), Kentucky (2008, 2010-2012), Florida (2005-2014), Maryland (2002-2012), and New Jersey (2004, 2006-2103). See text for ICD-9 definitions of outcomes. County level unemployment data come from Bureau for Labor Statistics. Unemployment rate, death rates, and ED visit rates are all weighted by total county population of group. Hispanic ED visits are omitted as the ED data do not contain a reliable indicator of Hispanic ethnicity.

Table 3: The estimated effect of county-level unemployment on the rate of opioid/drug mortality and emergency department visits across multiple specifications.

	(1)	(2)	(3)
<i>Opioid Death Rate per 100k</i>			
Unemployment Rate, [1-100]	0.22*** (0.05)	0.19*** (0.04)	0.19*** (0.05)

Year Fixed-Effects	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
State Specific Time Trends	No	Yes	No	Yes	No	Yes	No	Yes

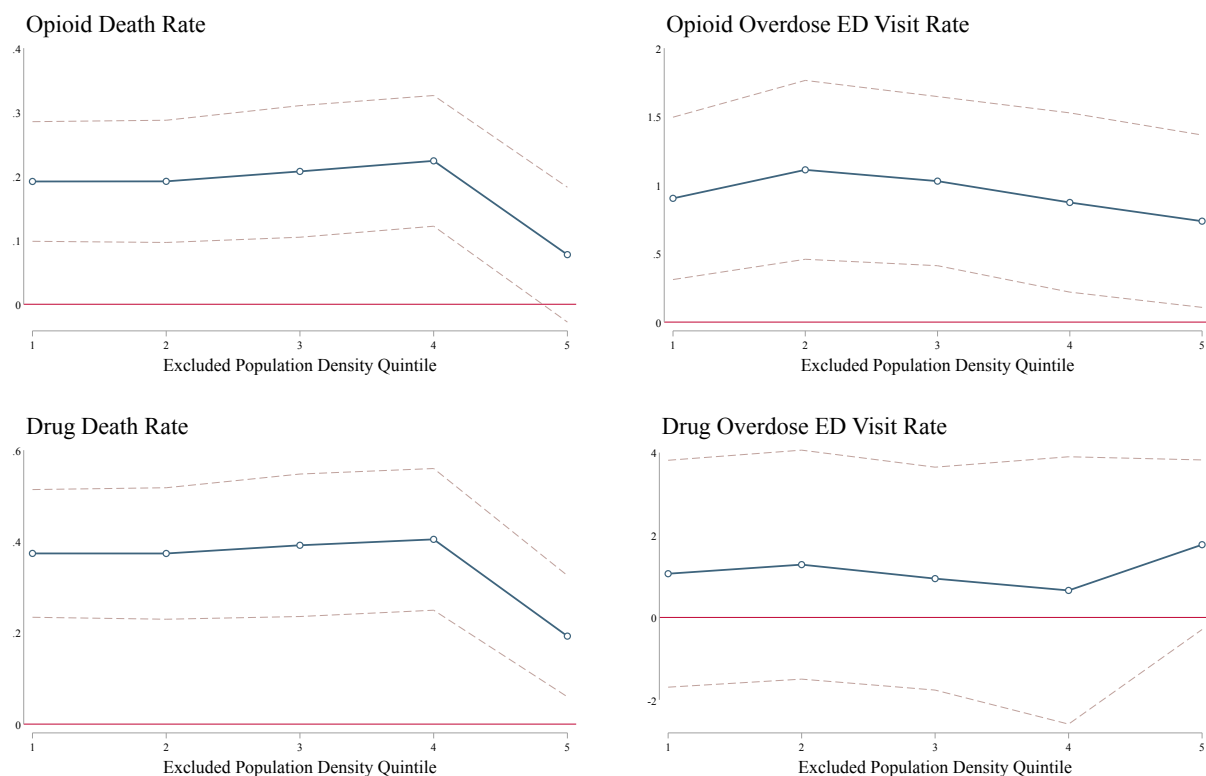

Note: * p < 0.1, ** p < 0.05, *** p < 0.01. Robust standard errors clustered at the state level in parentheses. Each regression is weighted by total state population of group. Hispanic ED visits are omitted as the ED data do not contain a reliable indicator of Hispanic ethnicity.

Figure A1: The estimated effect of county-level unemployment on the rate of opioid/drug mortality and emergency department visits excluding various three-year bins.

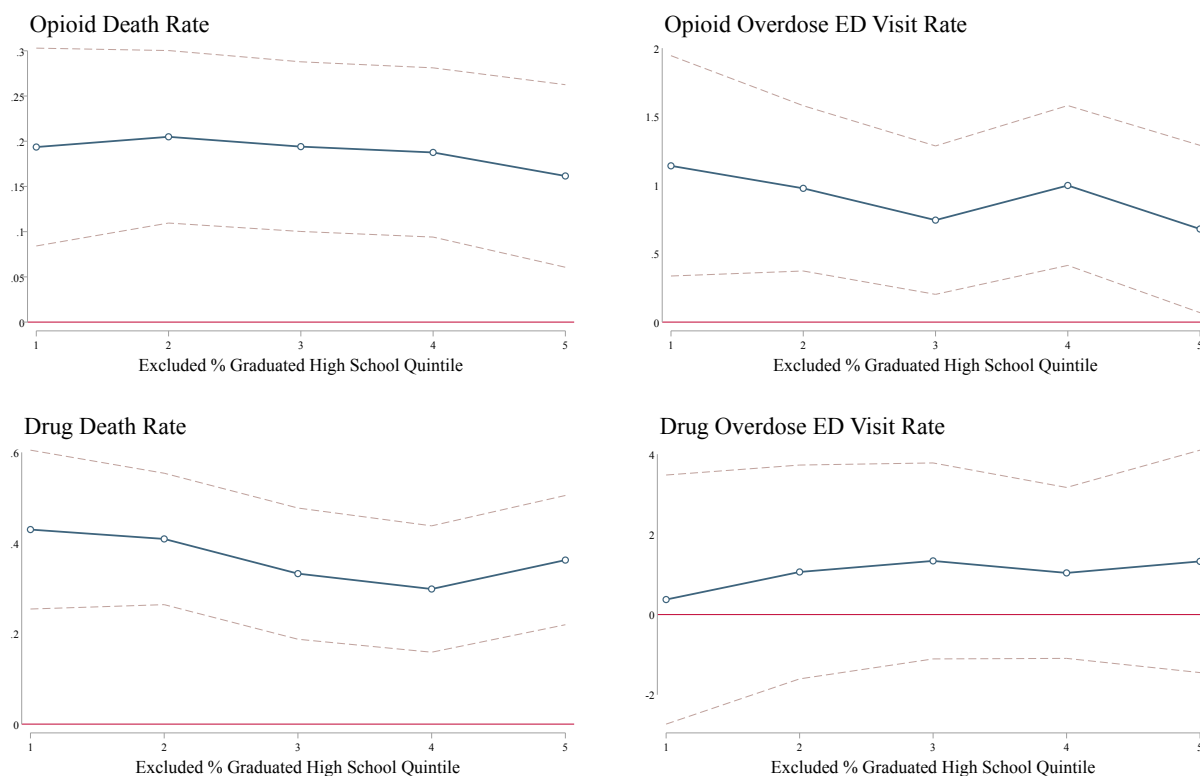

Note: Each point is from a separate regression that corresponds to our preferred specification in the text. Each regression has county fixed-effects, year fixed-effects, and state-by-year fixed effects. Each regression excludes the years noted. 95% confidence intervals are displayed by dashed lines and are calculated using robust standard errors clustered at the county level. Each regression is weighted by total county population.

Figure A2: The estimated effect of county-level unemployment on the rate of opioid/drug mortality and emergency department visits excluding population density quintiles.

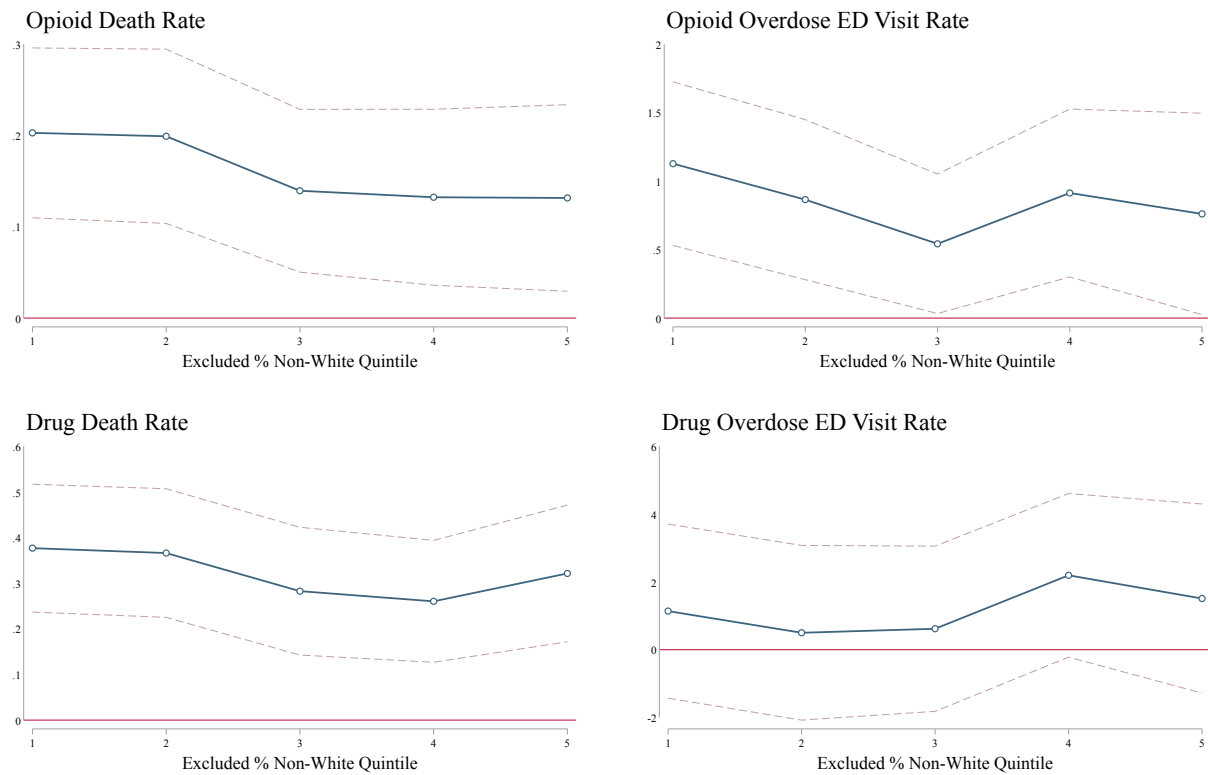

Note: Each point is from a separate regression that corresponds to our preferred specification in the text. Each regression has county fixed-effects, year fixed-effects, and state-by-year fixed effects. Each regression excludes the quintile noted. 95% confidence intervals are displayed by dashed lines and are calculated using robust standard errors clustered at the county level. Each regression is weighted by total county population.

Figure A3: The estimated effect of county-level unemployment on the rate of opioid/drug mortality and emergency department visits excluding % graduated high school quintiles

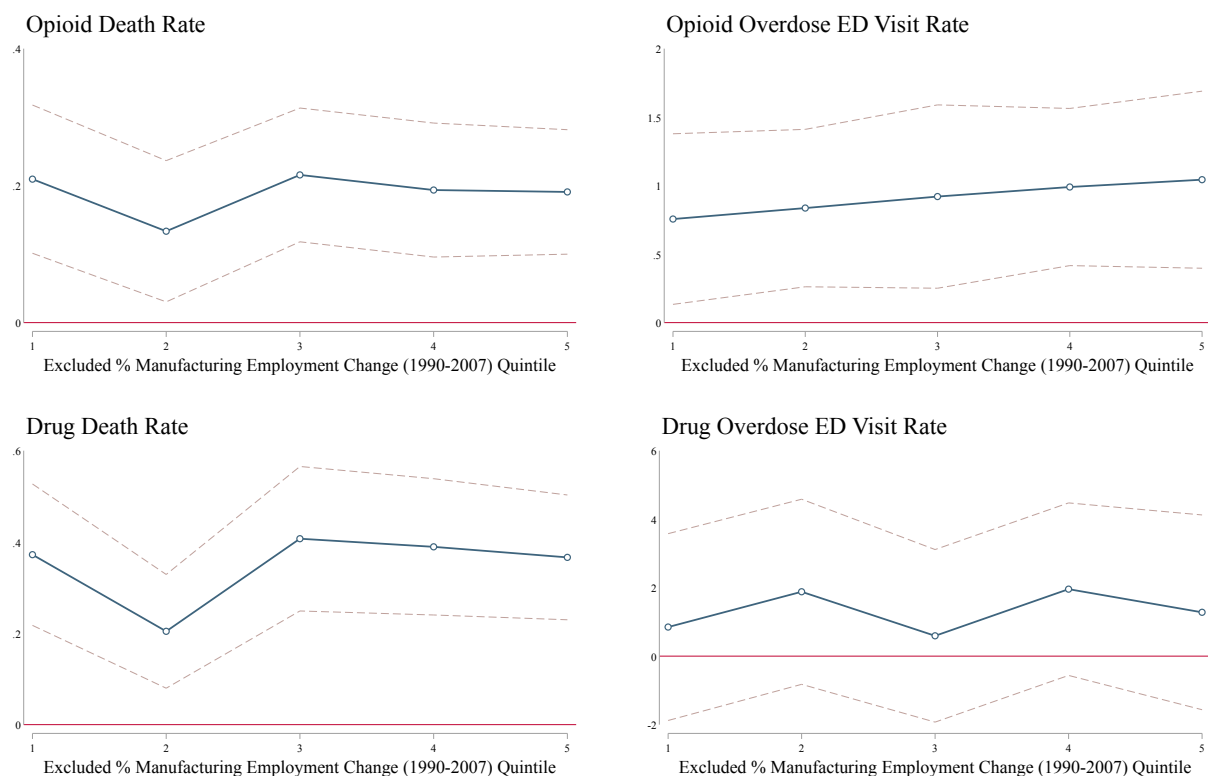

Note: Each point is from a separate regression that corresponds to our preferred specification in the text. Each regression has county fixed-effects, year fixed-effects, and state-by-year fixed effects. Each regression excludes the quintile noted. 95% confidence intervals are displayed by dashed lines and are calculated using robust standard errors clustered at the county level. Each regression is weighted by total county population.

Figure A4: The estimated effect of county-level unemployment on the rate of opioid/drug mortality and emergency department visits excluding % non-white quintiles

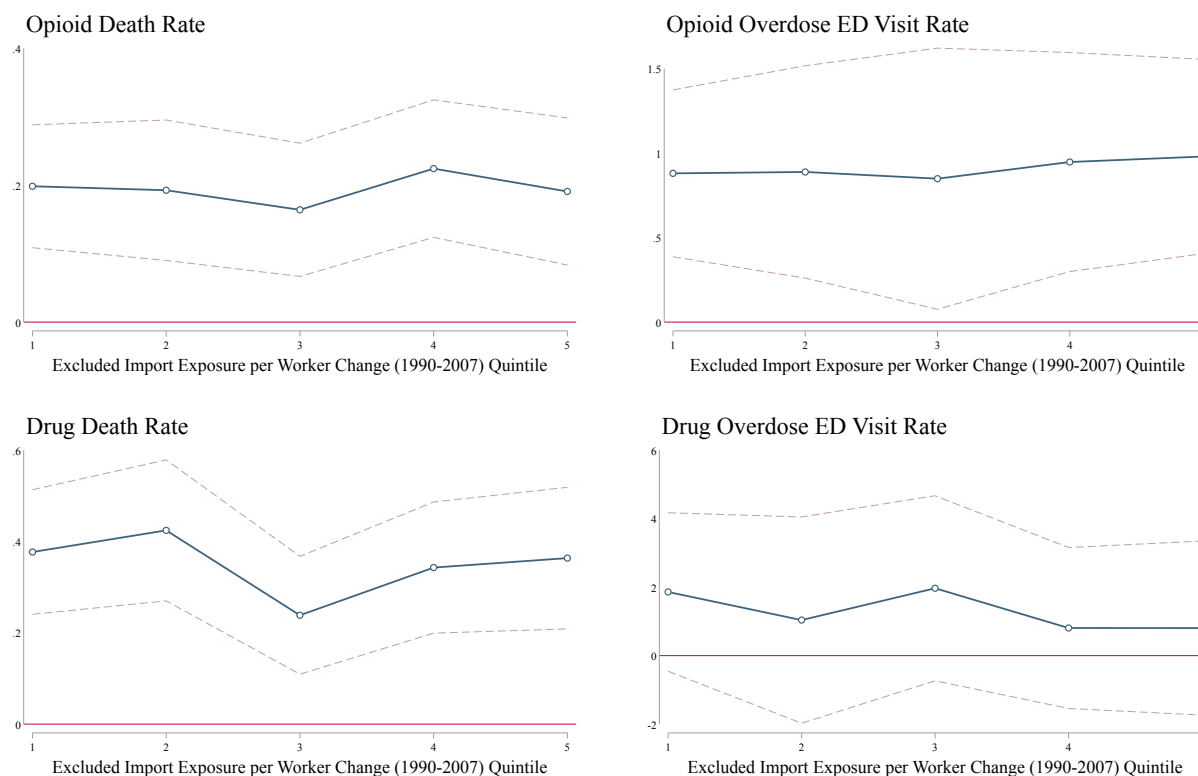

Note: Each point is from a separate regression that corresponds to our preferred specification in the text. Each regression has county fixed-effects, year fixed-effects, and state-by-year fixed effects. Each regression excludes the quintile noted. 95% confidence intervals are displayed by dashed lines and are calculated using robust standard errors clustered at the county level. Each regression is weighted by total county population.

Figure A5: The estimated effect of county-level unemployment on the rate of opioid/drug mortality and emergency department visits excluding change in % manufacturing employment (1990-2007) quintiles

Note: Each point is from a separate regression that corresponds to our preferred specification in the text. Each regression has county fixed-effects, year fixed-effects, and state-by-year fixed effects. Each regression excludes the quintile noted. 95% confidence intervals are displayed by dashed lines and are calculated using robust standard errors clustered at the county level. Each regression is weighted by total county population. Data on change in manufacturing employment come from Autor et al. (2013). The lower the quintile, the larger the decrease in the share of manufacturing employment.

Figure A6: The estimated effect of county-level unemployment on the rate of opioid/drug mortality and emergency department visits excluding change in import exposure (1990-2007) quintiles

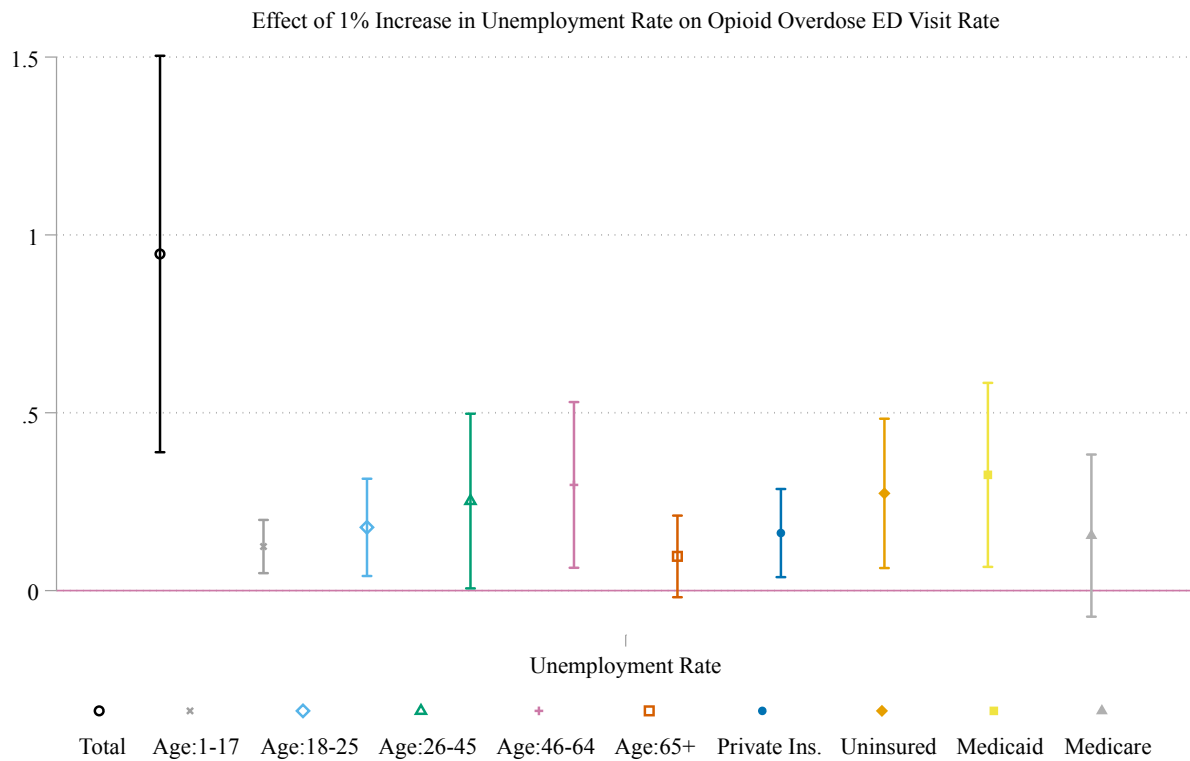

Note: Each point is from a separate regression that corresponds to our preferred specification in the text. Each regression has county fixed-effects, year fixed-effects, and state-by-year fixed effects. Each regression excludes the quintile noted. 95% confidence intervals are displayed by dashed lines and are calculated using robust standard errors clustered at the county level. Each regression is weighted by total county population. Data on change in manufacturing employment come from Autor et al. (2013). The lower the quintile, the smaller the change in import exposure.

Figure A7: The effect of county-level unemployment on the rate of opioid ED visits and the rate of ED visits for various placebos.

Note: Each point is from a separate regression that corresponds to our preferred specification in the text. Each regression has county fixed-effects, year fixed-effects, and state-by-year fixed effects. 95% confidence intervals are displayed by bracketed lines and are calculated using robust standard errors clustered at the county level. Each regression is weighted by total county population.

Figure A8: The effect of county-level unemployment on the opioid ED visit rate across various age groups and expected payer.

Note: Each point is from a separate regression that corresponds to our preferred specification in the text. Each regression has county fixed-effects, year fixed-effects, and state-by-year fixed effects. 95% confidence intervals are displayed by bracketed lines and are calculated using robust standard errors clustered at the county level. Each regression is weighted by total county population.

Figure A9: All Drug Death Rate by Race, 1999-2014

Figure A10: Simulated Power Analysis For All Drug Overdose ED Visit Rate

Note: The dashed vertical line is the estimated effect size of 1 percentage point increase in the unemployment rate on the opioid overdose ED visit rate. α is the probability of a type I error.

Table A1: The estimated effect of county-level unemployment on the rate of opioid/drug mortality and emergency department visits across various types of time trends.

	<u>Opioid Death Rate</u> (1)	<u>All Drug Death Rate</u> (2)	<u>Opioid ED Visit Rate</u> (3)	<u>Drug ED Visit Rate</u> (4)
<i>All Races/Ethnicities</i>

Observations	1873	874	929
County Fixed-Effects	Yes	Yes	Yes
Year Fixed-Effects	Yes	Yes	Yes
County Specific Time Trends	No	No	No
State-by-Year Fixed-Effects	Yes	Yes	Yes

Note: * p < 0.1, ** p < 0.05, *** p < 0.01. Robust standard errors clustered at the county level in parentheses. Each regression is weighted by total county population.

Table A11: The estimated effect of county-level unemployment on mortality rate from opioids, baseline and accounting for variance in imputation procedure. **Note: Estimates are slightly different from results reported in JHE due to random number seed used in Stata.**

	(1) All	(2) White	(3) Black	(4) Hispanic
<i>Baseline: Opioid Death Rate per 100k</i>				
Unemployment Rate, [0-100]	0.1889*** (0.0453)	0.2350*** (0.0516)	-0.1411** (0.0718)	0.0399 (0.0289)
<i>Multiple Imputation: Opioid Death Rate per 100k</i>				
Unemployment Rate, [0-100]	0.1889*** (0.0453)	0.2350*** (0.0516)	-0.1411** (0.0718)	0.0399 (0.0289)
Observations	50132	50132	49630	50090
County Fixed-Effects	Yes	Yes	Yes	Yes
Year Fixed-Effects	Yes	Yes	Yes	Yes
County Specific Time Trends	No	No	No	No
State-by-Year Fixed-Effects	Yes	Yes	Yes	Yes

Note: * $p < 0.1$, ** $p < 0.05$, *** $p < 0.01$. Robust standard errors clustered at the county level in parentheses. Each regression is weighted by county population of group. The specification that accounts for imputation uncertainty is an average of 100 different specifications, each identical except using a different dataset. Each datasets is drawn from the imputed variables to capture the uncertainty in the measurement. Coefficients and standards errors are calculated using Rubin's (1987) rules as outlined in White et al. (2011). Coefficients and standard errors are reported to four decimal points so differences are salient.

Table A12: The estimated effect of county-level unemployment on the rate of emergency department visits for each of the top ED categories.
